

careful

The user overthinks each step, slowing down interaction.

defensive

The user resists changing their approach, even if it's ineffective.

overconfident

The user assumes they know exactly how the device works (even if they don't).

impatient

The user gets frustrated if the device does not respond quickly.

confused

The user doesn't fully understand how the device works.

user

**Your Role:** You are the User. You will take on a persona based on your dice roll and engage with the device accordingly to achieve a task.

playful

The user experiments and interacts in a non-standard way.

curious

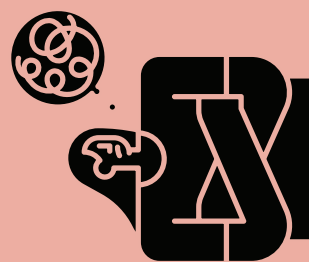

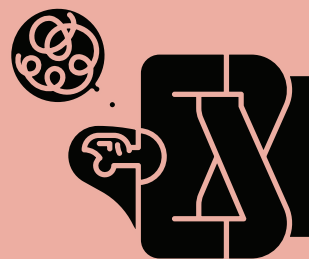

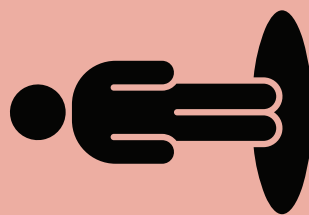

The user deliberately tries to explore or "break" the system.

anxious

The user is nervous about getting the task wrong.

disinterested

The user is disengaged and unwilling to explore the device fully.

non intuitive  
gesture

The device only responds  
to gestures that aren't  
clearly indicated

random error  
message

The device frequently  
displays vague or unhelpful  
error messages

overly sensitive  
controls

The device reacts too  
quickly to minor inputs

mandatory  
update

The device requires an  
update before it can be  
used

inconsistent  
connectivity

A wireless feature  
disconnects randomly

accidental  
activation

The device performs an  
action without user input

auto  
shutdown

The device suddenly powers  
off without warning

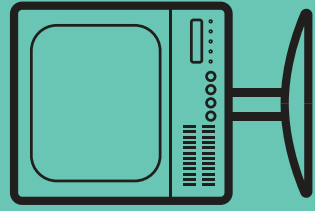

broken  
component

A key part of the device is  
unavailable or damaged

limited  
functionality

A key feature is locked or  
restricted due to settings or  
permissions

**Your Role:** You are the  
Designer. The Designer's  
instructions dictate your  
behaviour. You are trying to  
assist the user in achieving  
their goal.

inconvenient  
placement

The device is mounted too high, too low, or at an awkward angle.

wet  
conditions

The device or the user's hands are damp/slippery.

unstable  
environment

The device is on an uneven or moving surface (e.g., a shaky table).

multiple  
users

Someone else is interfering with or helping with the interaction.

user is  
rushing

The user has limited time to interact with the device.

designer

**Your Role:** You are the Designer: Your job is to define the device, set the context, and observe the interaction.

cold  
environment

The user's fingers are stiff and less dexterous.

limited  
space

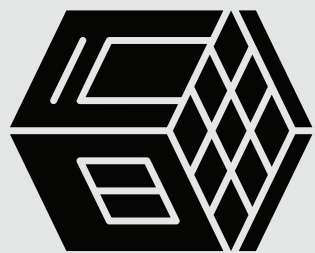

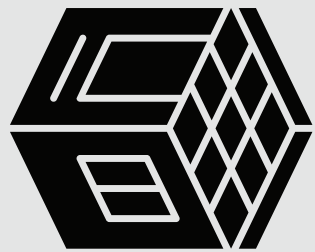

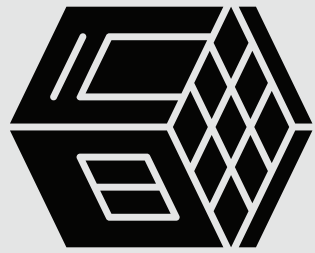

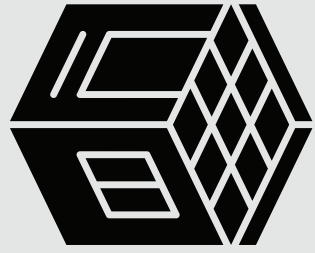

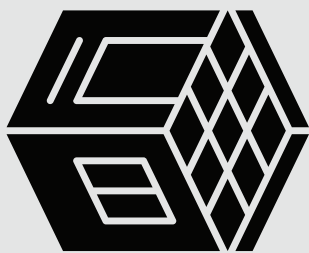

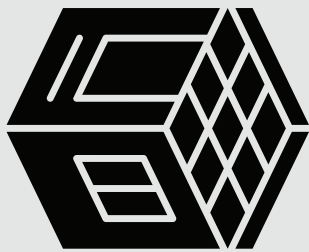

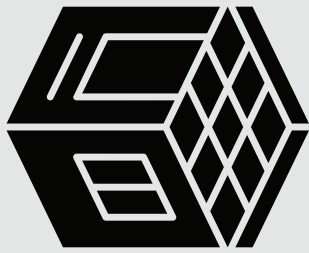

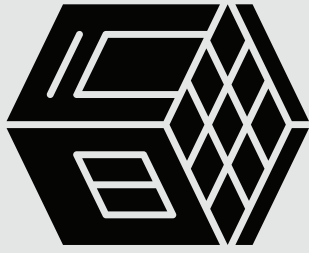

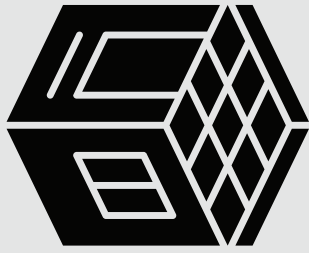

The user has very little room to move or adjust the device.

background  
distraction

The user is multitasking and not fully focused on the device.

disruptive  
setting

The interaction is happening in a crowded/unpredictable space.

## reflection

---

What moment in the game highlighted a major UX challenge?

## reflection

---

What aspects of user interaction are hardest to predict?

## reflection

---

How did your perspective on 'good design' shift after playing?

## reflection

---

What role did emotions (frustration, excitement, confusion) play in user interactions?

## reflection

---

Which wildcard modifier had the biggest impact on usability? Why?

## reflection

---

What is the biggest insight you gained from playing this game?

## reflection

---

If you had to explain one key takeaway from this game to a design team, what would it be?

## reflection

---

If this game were turned into a formal usability test, how would you structure it?

## reflection

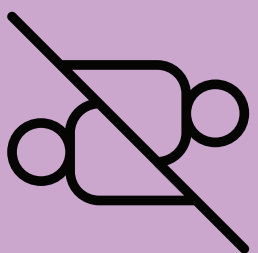

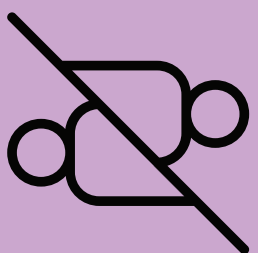

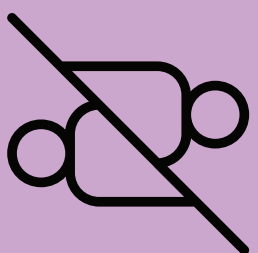

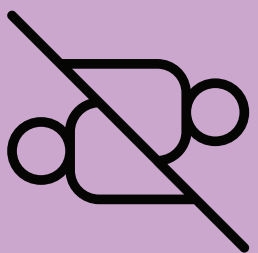

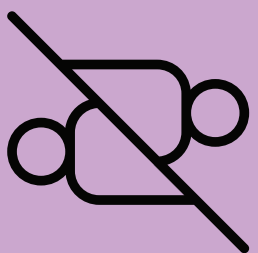

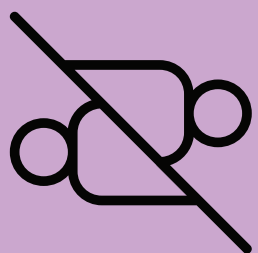

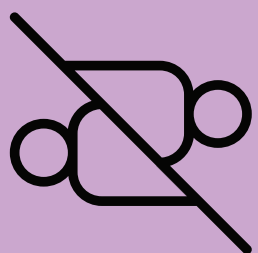

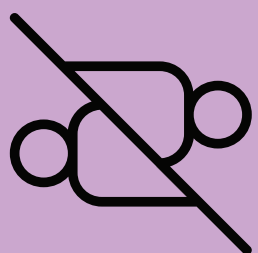

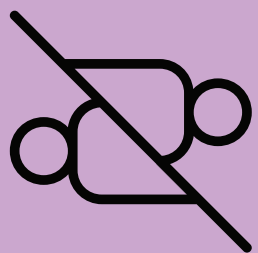

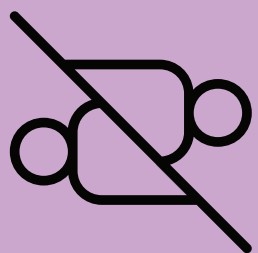

---

If you had to redesign the device based on this experience, what would you change?

## reflection

---

What did this game teach you about designing for accessibility?

## reflection

---

How did impairments affect the way the device was used?

## noisy environment

---

Loud background noise makes verbal communication difficult.

## slow response time

---

The device takes longer than expected to process interactions

## frustrated

---

The device takes longer than expected to process interactions

## reflection

---

How did your assumptions about user behaviour change throughout the game?

## reflection

---

What was the most surprising interaction you observed? Why?

## low lighting

---

The user struggles to see the device's details.

## misleading feedback

---

The device provides unclear or conflicting responses

## excited

---

The user is already irritated before interacting.
